Let  $z$  be a primitive  $k$ th root of unity. Then the finite geometric sum  $\sum_{j=0}^{k-1} z^{ij}$  is  $k$  if  $i$  is a multiple of  $k$  and 0 otherwise. Choose  $y > 0$  with  $y^k = x$ . We obtain

$$\begin{aligned} \sum_{i \geq 0} \binom{kn}{ki+r} x^i &= \frac{1}{k} \sum_{i \geq 0} \binom{kn}{i+r} y^i \sum_{j=0}^{k-1} z^{ij} = \frac{1}{ky^r} \sum_{j=0}^{k-1} z^{-rj} \sum_{i \geq r} \binom{kn}{i} y^i z^{ij} \\ &= \frac{1}{ky^r} \sum_{j=0}^{k-1} z^{-rj} (1 + yz^j)^{kn} + O(n^{r-1}) = \frac{(1+y)^{kn}}{ky^r} (1 + o(1)) \end{aligned}$$

as  $n \rightarrow \infty$ , and this identity also holds with  $s$  in place of  $r$ . Therefore  $b_n \rightarrow y^{s-r} = x^{(s-r)/k}$  as  $n \rightarrow \infty$ .

*Editorial comment.* Jean Anglesio noted that when  $x$  is a complex number (but not a negative real) the limit is the principal value of the square root of  $x$ . When  $x < 0$  the limit does not exist.

Solved also by S. A. Ali, K. F. Andersen (Canada), J. Anglesio (France), D. Beckwith, C. Berg (Sweden), J. C. Binz (Switzerland), P. Bracken (Canada), D. Callan, R. J. Chapman (U. K.), J. E. Dawson (Australia), M. N. Deshpande (India), Z. Franco, C. Georghiu (Greece), T. Hermann, V. Hernandez (Spain), J.-H. Kim, R. A. Kopas, O. Kuba (Syria), N. F. Lindquist, J. H. Lindsey II, N. Lord (U. ### A Triangle Inequality

**10644** [1998, 175]. *Proposed by Mihály Bencze, Brazov, Romania.* Given an acute triangle with sides of length  $a$ ,  $b$ , and  $c$ , inradius  $r$ , and circumradius  $R$ , prove that

$$\frac{r}{2R} \leq \frac{abc}{\sqrt{2(a^2 + b^2)(b^2 + c^2)(c^2 + a^2)}}$$

*Solution by the GCHQ Problems Group, Cheltenham, England.* We have

$$\begin{aligned} a^2 - (b^2 + c^2)(1 - \cos A) &= b^2 + c^2 - 2bc \cos A - (b^2 + c^2) + (b^2 + c^2) \cos A \\ &= (b - c)^2 \cos A \geq 0, \end{aligned}$$

since  $A$  is acute. Hence  $a^2 \geq (b^2 + c^2)(1 - \cos A) = 2(b^2 + c^2) \sin^2(A/2)$ . It follows that  $a^2 b^2 c^2 \geq 8(a^2 + b^2)(b^2 + c^2)(c^2 + a^2) \sin^2(A/2) \sin^2(B/2) \sin^2(C/2)$ , and so

$$\frac{abc}{\sqrt{2(a^2 + b^2)(b^2 + c^2)(c^2 + a^2)}} \geq 2 \sin \frac{A}{2} \sin \frac{B}{2} \sin \frac{C}{2}.$$

The standard fact  $r = 4R \sin(A/2) \sin(B/2) \sin(C/2)$  now yields the required result.

*Editorial comment.* Several solvers noted that equality holds when the triangle is equilateral and that the result is valid also when the triangle is not acute.

Solved also by J. Anglesio (France), E. Braune (Austria), Z. Čerin (Croatia), J. Melville (Scotland), C. A. Minh, P. E. Nüesch (Switzerland), G. Peng, C. Popescu (Belgium), C. R. Pranesachar (India), S. M. Soltuz (Romania), M. Vowe (Switzerland), R. L. Young, SAS Maths Club (India), and the proposer.

### Limit of a Recurrence

**10648** [1998, 271]. *Proposed by N. P. Bhatia, University of Maryland, Baltimore County, MD, and W. O. Egerland, Bel Air, MD.* Let  $z_1, z_2, \dots, z_m$  be  $m \geq 2$  points in the complex plane, and let  $p_1, p_2, \dots, p_m$  be positive real numbers such that  $p_1 + p_2 + \dots + p_m = 1$ . For  $\omega$  real and  $n > m$ , let  $z_n = (p_1 z_{n-1} + p_2 z_{n-2} + \dots + p_m z_{n-m}) e^{i\omega}$ . Show that the sequence  $z_1, z_2, \dots$  converges, and determine its limit.
