

Standard Test Method for Compression-Recovery of Tape Sealant¹

This standard is issued under the fixed designation C 972; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This test method describes a laboratory procedure for determining compression-recovery characteristics of tape sealant.

1.2 The values stated in SI units are to be regarded as the standard. The values given in parentheses are for information only.

1.3 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.* Table 1

NOTE 1—There are no ISO standards similar or equivalent to this ASTM standard.

2. Referenced Documents

2.1 *ASTM Standards:*

E 177 Practice for Use of the Terms Precision and Bias in ASTM Test Methods³

E 691 Practice for Conducting an Interlaboratory Study to Determine the Precision of a Test Method³

3. Terminology

3.1 *Definitions*—For definitions of terms used in this test method, refer to Terminology C 717.

4. Significance and Use

4.1 Tape sealants are tacky, deformable solids used under compression between two or more surfaces of similar or dissimilar materials in a variety of sealing applications. This procedure presents an indication of the compression recovery characteristics of preformed tapes.

5. Apparatus

5.1 *Glass Plates*, two, each 6.35 by 76.2 by 76.2 mm (0.25 by 3 by 3 in.).

5.2 *Steel Panels*, two, cold-rolled, each 0.762 by 76.2 by 76.2 mm (0.03 by 3 by 3 in.).

NOTE 2—Substitutes such as aluminum, acrylic, acrylonitrile-butadiene-styrene (ABS), may be substituted for the plates (5.1) and panels (5.2).

5.3 *Compression Testing Machine*, with a cross-head speed of 50 mm (2 in.)/min and capable of stopping at specified settings.

NOTE 3—Load values may differ when determined on screw-type versus spring-type test machines due to a drift past the desired stop in the spring-type machine. It may be necessary to use shims to obtain the desired stop.

5.4 *Recorder*, for recording compression loads in newtons (or pounds-force).

5.5 *Stop Watch*, measuring in minutes and seconds.

5.6 *Gage or Rule*, capable of measuring tape thickness to 0.025 mm or 0.001 in.

6. Test Specimen and Sample

6.1 *Conditioning:*

6.1.1 Condition the specimens for 24 h at $23 \pm 2^\circ\text{C}$ ($73.4 \pm 3.6^\circ\text{F}$) and $50 \pm 10\%$ relative humidity.

6.1.2 Other conditioning parameters may be included as desired.

6.2 Samples to be tested shall be taken from a roll or tape sealant after first removing and discarding approximately the first 0.6 m (2 ft) of the roll.

6.3 Tape sealant configuration should be approximately 9.53 by 9.53 by 76.2 mm (0.375 by 0.375 by 3 in.). The sample should be re-extruded rather than plied to conform to the specified size if the sample does not approximate these dimensions.

6.4 Total tape volume (V) should be calculated (width by length by thickness) for determination of tape sealant compression index.

6.5 Prepare two test specimens for each sample as follows:

6.5.1 Do not clean or unnecessarily handle the surfaces of surface-treated or painted plate or panels.

6.5.2 Clean plates or panels with detergent or solvent, or both.

6.5.3 Place two 76.2 by 9.53 by 9.53-mm (3 by 0.375 by 0.375-in.) lengths of tape sealant on one of the plates or panels, as shown in Fig. 1, and remove the release paper. Place the

TABLE 1 Indexes of Precision

Source of Variability	Symbol	Force to Compress, N (lbf)	Recovery, 5 min, mm (in.)	Recovery, 2 h, mm (in.)
Repeatability (within laboratory)	$I(r)$	50.5 (11.34)	0.43 (0.017)	0.30 (0.012)
Reproducibility (between laboratories)	$I(R)$	443.0 (99.56)	0.76 (0.030)	0.76 (0.030)

FIG. 1 Compression Recovery Test Sample

second plate or panel over the tape sealant to complete the test specimen in accordance with Fig. 1.

7. Procedure

7.1 Place the specimen in a laboratory press or equivalent equipment, and compress the specimen at 51 mm (2 in.)/min until the sealant tape thickness is 5.1 mm (0.20 in.). Maintain the compression mode for exactly 1 min, recording maximum compressive load in newtons or pounds force. At the end of 1 min, raise the press crosshead and remove the specimen, taking care not to disturb the specimen.

7.2 After removing the specimen from the press, measure and record the tape sealant thickness after 5 min and after 2 h.

8. Calculations

8.1 Calculate the compression load and recovery height for each specimen as follows:

$$R_1 = T_1 - 5.1 \text{ mm (0.200 in.)} \quad (1)$$

where:

R_1 = free recovery height after 5 min, and
 T_1 = tape thickness after 5 min.

$$R_2 = T_2 - 5.1 \text{ mm (0.200 in.)} \quad (2)$$

where:

R_2 = free recovery height after 2 h, and
 T_2 = tape thickness after 2 h.

$$P_c = P/V \quad (3)$$

where:

P_c = tape compression index, N/mm^3 (lbf/in.^3),
 P = maximum compression load, N (lbf), and
 V = total tape sealant volume, mm^3 (in.^3).

9. Report

9.1 The report shall include the following:

9.1.1 Average recovery height after 5 min and after 2 h to the nearest 5.1 mm (0.001 in.),

9.1.2 Average tape sealant compression index in newtons per cubic millimetre (or pounds-force per cubic inch), and

9.1.3 Type of compression equipment used.

10. Precision and Bias⁴

10.1 Three laboratories were used in the force to compress testing and four laboratories were used for both recovery tests (5 min and 2 h).

10.2 *Repeatability I(r)*—The repeatability interval (within a given laboratory) for four materials tested by three (or four) laboratories is listed in Table 1 for each of the calculated values defined in Section 8.

10.3 *Reproducibility I(R)*—The reproducibility interval (between given laboratories) for four materials tested by three (or four) laboratories is listed in Table 1 for each of the calculated values defined in Section 8.
