

## Standard Practice for Interconversion of Analysis of C<sub>5</sub> and Lighter Hydrocarbons to Gas-Volume, Liquid-Volume, or ~~Weight~~ Mass Basis<sup>1</sup>

This standard is issued under the fixed designation D 2421; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

### 1. Scope

1.1 This practice describes the procedure for the interconversion of the analysis of C<sub>5</sub> and lighter hydrocarbon mixtures to gas-volume (mole), liquid-volume, or ~~weight in vacuum~~ mass basis.

1.2 The computation procedures described assume that gas-volume percentages have already been corrected for nonideality of the components as a part of the analytical process by which they have been obtained. These are numerically the same as mole percentages.

1.3 The procedure assumes the absence of nonadditivity corrections for mixtures of the pure liquid compounds. This is approximately true only for mixtures of hydrocarbons of the same number of carbon atoms, and in the absence of diolefins and acetylenic compounds.

1.4 The values stated in SI units are to be regarded as the standard. The values given in parentheses are for information only.

1.5 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

### 2. Source of Data

2.1 The basic values for the relative density 15.6/15.6°C (60/60°F) of the pure compounds have been obtained from the Thermodynamics Research Center, Texas A & M University, except where otherwise noted. The values for methane, ethylene, and acetylene are not those of pure materials but are assumed to apply as a component of a liquid mixture.

2.2 The conversion factors for 1 mL of ideal gas at 15.6°C (60°F) and 101.3 kPa (760 mm Hg) to millilitres of liquid at 15.6°C (60°F) have been calculated as follows:

<sup>1</sup> This practice is under the jurisdiction of ASTM Committee D02 on Petroleum Products and Lubricants and is the direct responsibility of Subcommittee D02.H on Liquefied Petroleum Gas.

Current edition approved ~~Aug. April~~ 10, 2004<sup>2</sup>. Published ~~October 2004~~ June 2002. Originally published as D 2421 – 65 T. Last previous edition D 2421 – 9501.

1 mL gas at 15.6°C (60°F), 101.3 kPa (760 mm Hg),

$$L = (273.16/288.72) \times (M/22414) \times [1/((\text{relative density}) \times (0.99904))] \times [1/((\text{relative density}) \times (0.99904))] \times 4.2251 \times 10^{-5} \times (M/\text{relative density}) = \text{millilitres liquid at } 15.6^\circ\text{C (60}^\circ\text{F)}$$
(1)

where:

$M$  = molecular ~~weight~~ mass of the pure compound, and

Relative density = relative density, 15.6/15.6°C (60/60°F) (vacuum), of the pure compound.

2.3 Where ideal gas volumes have been measured at temperatures and pressures different from 15.6°C (60°F) at 101.3 kPa (760 mm Hg), they must be corrected to these conditions.

### 3. Significance and Use

3.1 For custody transfer and other purposes, it is frequently necessary to convert a component analysis of light hydrocarbon mixture from one basis (either gas-volume, liquid volume, or ~~weight~~ mass) to another.

3.2 The component distribution data of light hydrocarbon mixtures can be used to calculate physical properties such as relative density, vapor-pressure, and calorific value. Consistent and accurate conversion data are extremely important when calculating vapor, liquid, or mass equivalence.

### 4. Procedure

4.1 To convert from the original to the desired basis, multiply or divide the percent of each compound in the original basis according to the schedule shown in Table 1. Perform the calculation, using the corresponding factor indicated in Table 2. Carry at least one more significant figure in all of the calculations than the number of significant figures in the original analysis.

NOTE 1—The factors or percentages can be multiplied by any constant number for convenience (such as moving the decimal) without changing the end result.

4.2 Add the products or quotients obtained in accordance with 4.1.

4.3 Multiply the products or quotients obtained in accordance with 4.1 by 100 divided by the sum of the products or quotients. Round off the results so that the same number of significant figures is obtained in the final answer as was used in the original analysis.

**TABLE 1 Conversion Factors Scheduled**

Original Basis	Desired Basis	Operation	Factor Column in Table 2
Gas-volume	<u>weight</u>	<u>multiply by</u>	4
Gas-volume	<u>mass</u>	<u>multiply by</u>	1
Gas-volume	<u>liquid-volume</u>	<u>multiply by</u>	2
<u>Weight</u>	<u>gas-volume</u>	<u>divide by</u>	4
<u>Mass</u>	<u>gas-volume</u>	<u>divide by</u>	1
<u>Weight</u>	<u>liquid-volume</u>	<u>divide by</u>	3
<u>Mass</u>	<u>liquid-volume</u>	<u>divide by</u>	3
<u>Liquid-volume</u>	<u>gas-volume</u>	<u>divide by</u>	2
<u>Liquid-volume</u>	<u>weight</u>	<u>multiply by</u>	3
<u>Liquid-volume</u>	<u>mass</u>	<u>multiply by</u>	3

**TABLE 2 Weight-Mass-Volume Data for Liquefied Petroleum Gases and Low Boiling Hydrocarbons**

Compound	Column 1	Column 2	Column 3	Source
	Molecular Weight	Liquid Volume in mL of 1 mL of ideal gas at 15.6°C (60°F) and 101.3 kPa (760 mm Hg)	Relative Density 15.6/15.6°C (60/60°F) (Vacuum)

4.4 Add the percentages of the desired basis from 4.3 and distribute the round-off error (difference between the sum and 100 %) proportionately. Usually only the largest percentage will be changed in the final digit.

NOTE 2—For sample calculations, see the Appendix.

## 5. Keywords

5.1 analysis; liquefied petroleum gases; natural gas liquids

## APPENDIX

### (Nonmandatory Information)

#### X1. EXAMPLES

##### X1.1 Example 1:

Original basis: Gas-volume or mole, %

Desired basis: ~~Weight-Mass~~

Compound	Original Basis Mole, %	Operation (Table 1)	Factor Column 1 (Table 2)		Product
Methane	33.3	×	16.043	=	534.2
Ethane	33.3	×	30.07	=	1001.3
Propane	33.4	×	44.097	=	1472.8
<i>Total</i>	100.0				3008.3
$100.0/3008.3 = 0.03324$					

Compound	Product	Weight, Mass, %
Methane	$534.2 \times 0.03324 =$	17.8
Ethane	$1001.3 \times 0.03324 =$	33.3
Propane	$1472.8 \times 0.03324 =$	48.9
<i>Total</i>		100.0

### X1.2 Example 2:

Original basis: ~~Weight~~

Desired Mass

Desired basis: Liquid-volume

Compound	Original Basis Weight, Mass, %	Operation (Table 1)	Factor Column 3 (Table 2)		Quotient
Ethane	5.06	÷	0.35639	=	14.2
Propane	92.91	÷	0.50736	=	183.12
Isobutane	2.03	÷	0.56293	=	3.61
<i>Total</i>					200.93
$100/200.93 = 0.4977$					

Compound	Quotient		% by Liquid Volume, 15.6°C (60°F)
Ethane	$14.2 \times 0.4977$	=	7.07
Propane	$183.12 \times 0.4977$	=	91.14
Isobutane	$3.61 \times 0.4977$	=	1.79
<i>Total</i>			100.0

### X1.3 Example 3:

Original basis: Liquid-volume

Desired basis: Gas-volume

Compound	Original Basis Liquid Volume, %	Operation (Table 1)	Factor Column 2 (Table 2)		Quotient
Propane	10.0	÷	0.003672	=	2723
<i>n</i> -butane	84.3	÷	0.004205	=	20048
Isopentane	5.7	÷	0.004881	=	1168
<i>Total</i>					23939
$100/23939 = 0.004177$					

Compound	Quotient		% by Gas Volume (Ideal, 98.1 kPa, 15.6°C 1atm, 60°F)
Propane	$2723 \times 0.004177$	=	11.37
<i>n</i> -Butane	$20048 \times 0.004177$	=	83.75
Isopentane	$1168 \times 0.004177$	=	4.88
<i>Total</i>			100.0
