

Designation: D 5377 – 93 (Reapproved 2002)

# Standard Classification for Rubber Compounding Materials—Ground Coal<sup>1</sup>

This standard is issued under the fixed designation D 5377; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

## 1. Scope

1.1 This classification covers the compounding material known as ground coal. It is generally used in rubber compounds as a filler.

1.2 There are three grades of ground coal based on particle size, ash, and moisture. The selected values for these properties are suitable for use in a rubber compound.

Sample of Coal and Coke<sup>4</sup>

D 4371 Test Method for Determining the Washability Characteristics of Coal<sup>4</sup>

#### 3. Significance and Use

3.1 Ground coal is commonly used as an inexpensive filler in rubber compounds as a direct or partial replacement for carbon black or as a diluent in the compound.

3.2 Ground coal is very compatible with most rubbers and is very easily mixed into the compound.

#### 4. Basis of Classification

4.1 Particle size will have a direct effect on the modulus, tensile strength, and tear strength of the finished rubber.

4.2 Ash in the coal will effect the specific gravity and high ash can influence the curing characteristics of the rubber.

4.3 Moisture in the ground coal at levels of 0.5 % and above can cause blisters and scorch.

4.4 Lowering the density (specific gravity) will reduce compounding cost and affect volume loading.

4.5 Ground coal for use in rubber compounds shall conform to the three grades listed in Table 1.

## 5. Keywords

5.1 filler; ground coal
